| University POLITEHNICA of Bucharest Mechanics of Materials Laboratory |  |
| :---: | :---: |
| Student $\qquad$ <br> Faculty $\qquad$ Year $\qquad$ Group $\qquad$ <br> Date $\qquad$ | EXPERIMENTAL DETERMINATION OF YOUNG'S MODULUS AND POISSON'S RATIO |
| Aim of tests:: <br> To present the strain gauge measurements for obtaining the elastic constants of a material: <br> $E$ - Young's modulus, <br> $v$ - Poisson's ratio <br> The specimen <br> Material : OLC 45 <br> Diameter of the specimen: $d=16 \mathrm{~mm}$ <br> Cross section area: $A=$ $\qquad$ $\mathrm{mm}^{2}$ <br> Strain gauge constant: $k_{t}=2.05$ <br> (the constant of the strain gauge bridge is set to $k_{a}=k_{t}=2.05$ ) |     <br> $C_{1}$ $C_{2}$ $C_{3}$ $C_{4}$ <br> Active and dummy strain gauges and strain gauge bridges for measurement of the longitudinal and transversal strains |
| Formulae <br> For a variation of the applied force in steps o $\left(\Delta F_{i}\right)=F_{i}-F_{i-1}=2000 N,(i=1,2, \ldots, n)$, <br> the elastic constants are calculated using the $\begin{aligned} & E_{i}=\frac{(\Delta F)_{i}}{A\left(\Delta \varepsilon_{l}\right)_{i}} \cdot 10^{6} \\ & v_{i}=-\frac{\left(\Delta \varepsilon_{t}\right)_{i}}{\left(\Delta \varepsilon_{l}\right)_{i}} \end{aligned}$ <br> in which $\left(\Delta \varepsilon_{i}\right)_{i}$ and $\left(\Delta \varepsilon_{t}\right)_{i}$ are variations of the $\mu \mathrm{m} / \mathrm{m}$ ), obtained as a function of the values $\begin{aligned} & \left(\Delta \varepsilon_{l}\right)_{i}=\frac{1}{2} \cdot \frac{k_{a}}{k_{t}}\left[\left(I_{l}\right)_{i}-\left(I_{l}\right)_{i-1}\right] \\ & \left(\Delta \varepsilon_{t}\right)_{i}=\frac{1}{2} \cdot \frac{k_{a}}{k_{t}}\left[\left(I_{t}\right)_{i}-\left(I_{t}\right)_{i-1}\right],(i=1,2, \ldots, n) \end{aligned}$ <br> The average values of the elastic parameters calculated as: $\begin{aligned} & E=\frac{1}{n} \sum_{i=1}^{n} E_{i} \\ & v=\frac{1}{n} \sum_{i=1}^{n} v_{i} \end{aligned}$ <br> The obtained values are compared with thos | 2 kN : <br> quations: <br> longitudinal and transversal strains (expressed in $I_{)_{i}}$ and $\left(I_{t}\right)_{i}$ and of the strain gauge bridges: <br> $E$ and $v$ for the studied material are finally <br> currently used in strength calculations. |

Results of tests
